

# ORORGENIC GOLD MINERAL SYSTEMS IN FINLAND

1

**Ferenc Molnár**  
**Geological Survey of Finland**

## Contents of presentation

Lithospheric architecture in Finland

Archean and Paleoproterozoic mineral systems in Finland:

Orogenic gold mineral systems in Finland

Au-only and Au-base metal (Cu-Co-Ni)  
atypical metal associations

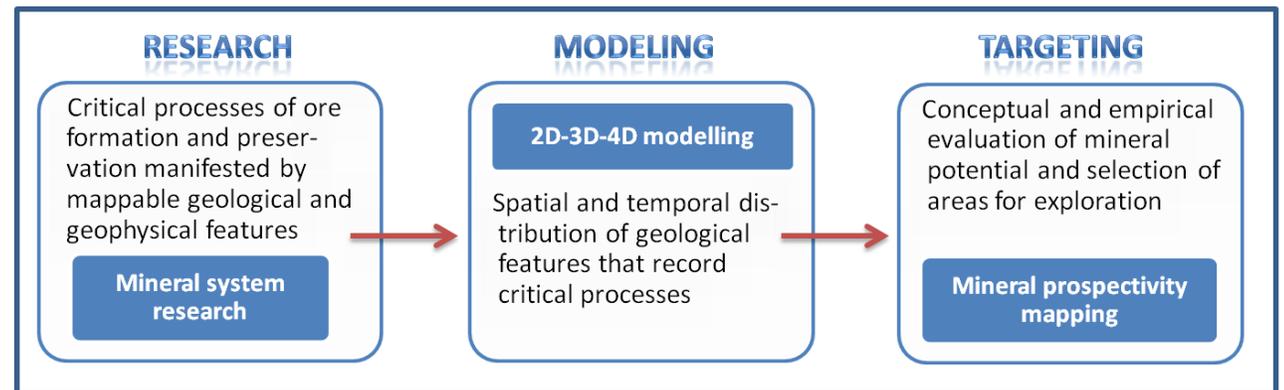

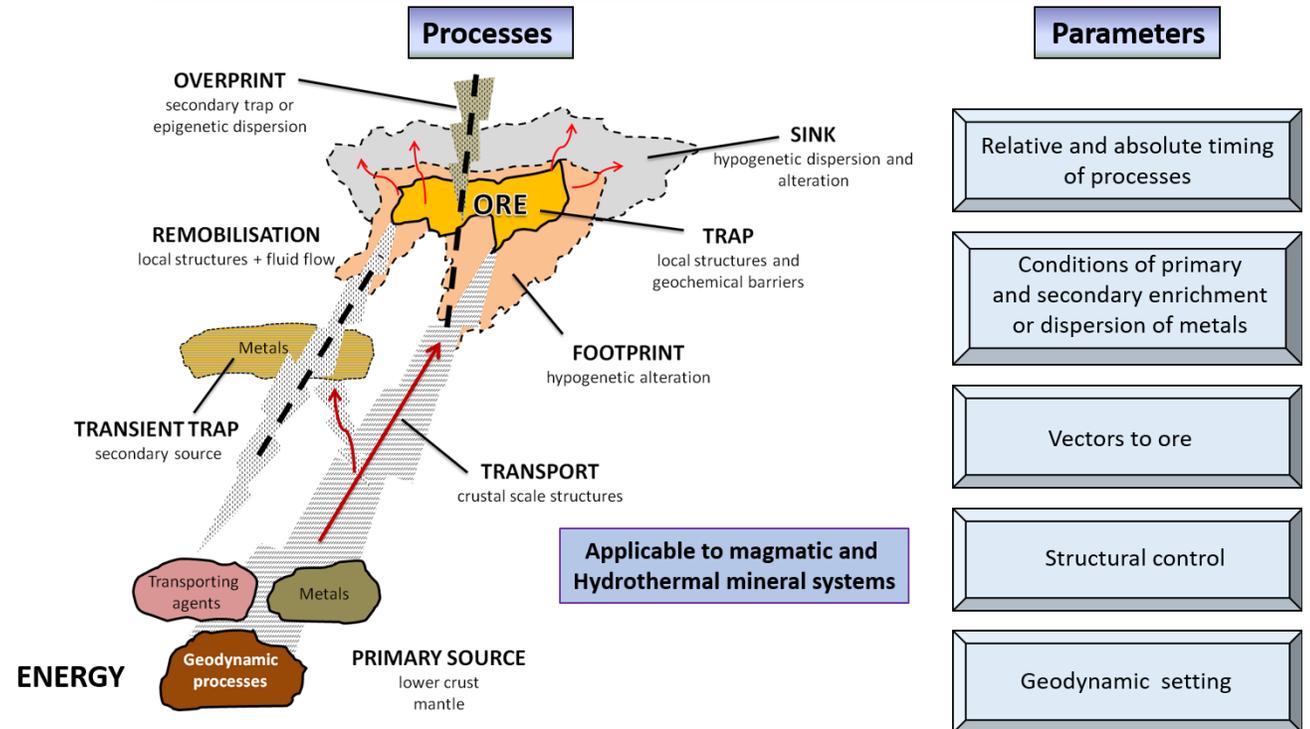

conduits – tectonic evolution and  
timing of ore deposition

footprints – vectors to ore

fluid sources

orogenic gold prospectivity

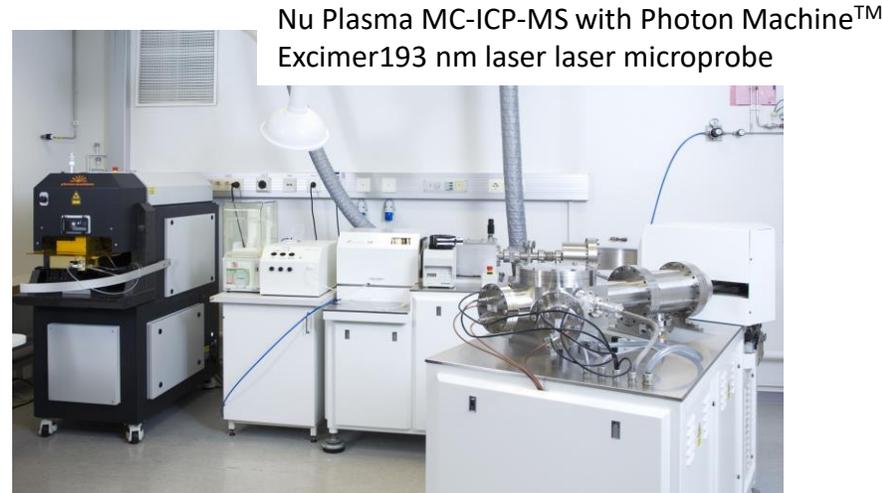

## Mineral Systems: Critical Processes and Parameters

# Laboratories for mineral systems research at GTK

Mineralogy, mineral chemistry

Geochronology, stable and radiogenic isotopes, trace elements

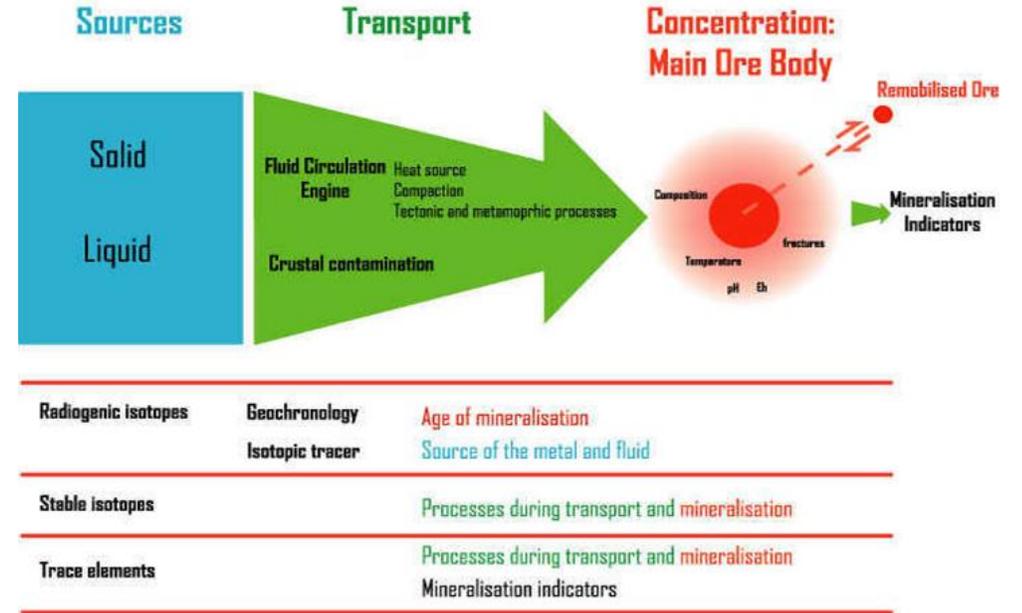

Linkam MDSG 600 microT

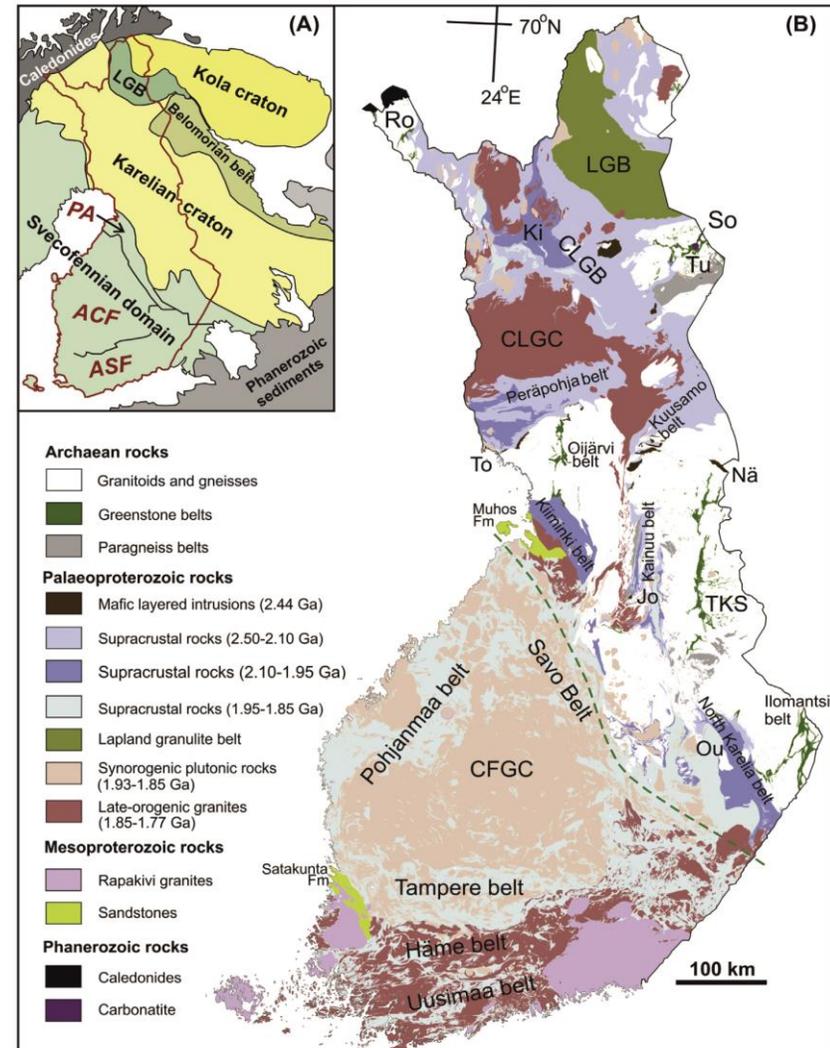

Access to CAMECA ims1280 ion microprobe  
NORDSIM, Stockholm

Fluid inclusions

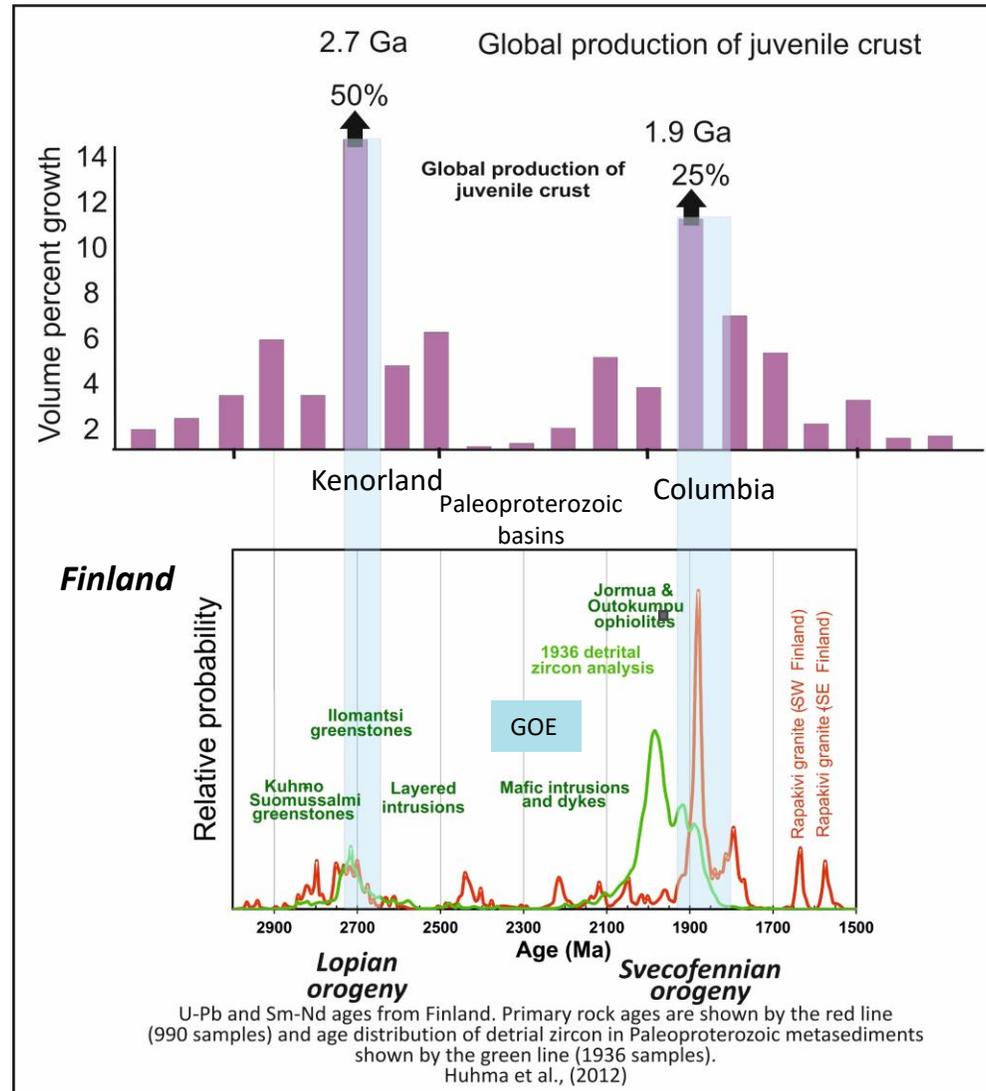

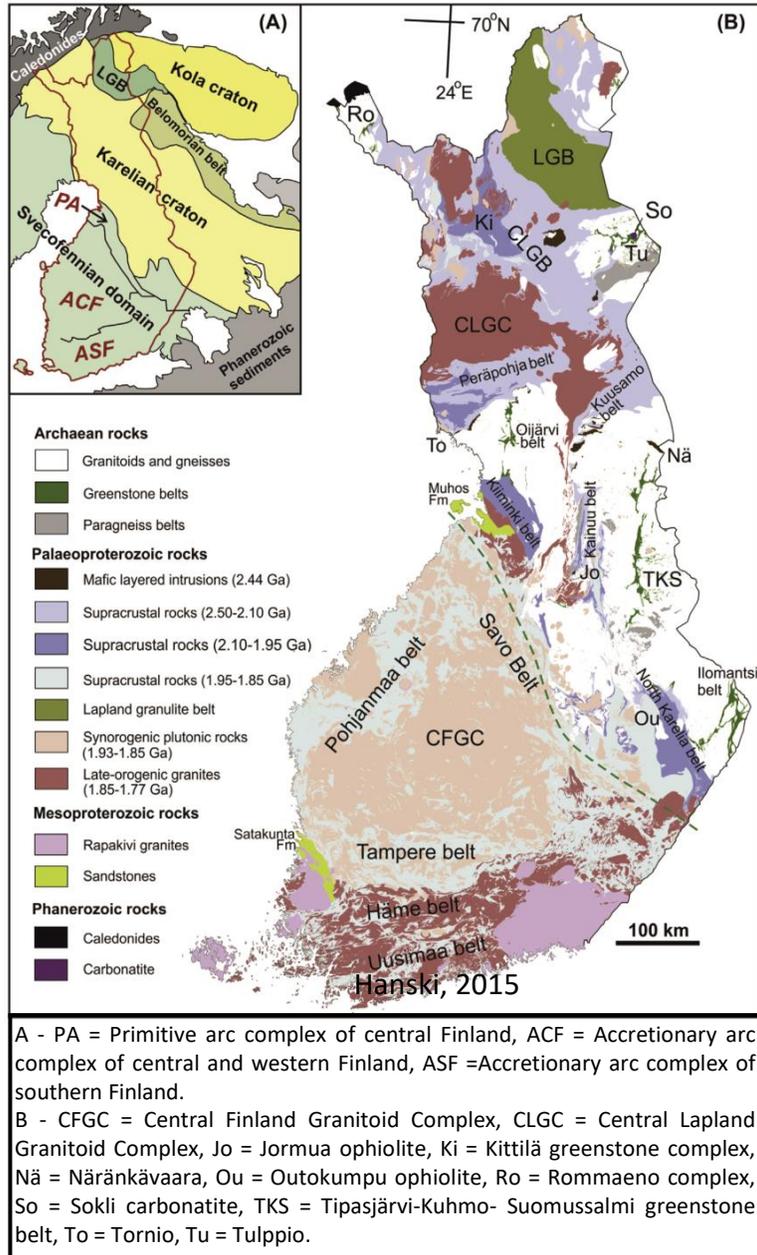

# Lithosphere architecture in Finland

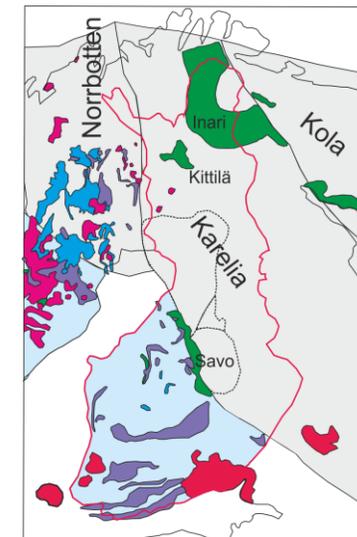

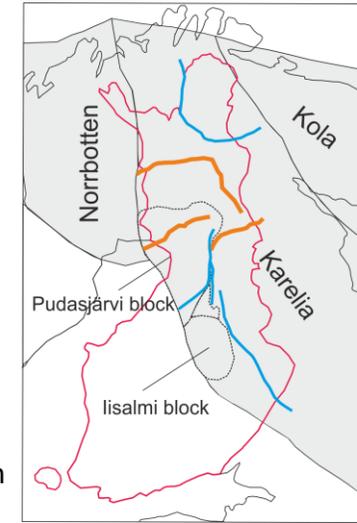

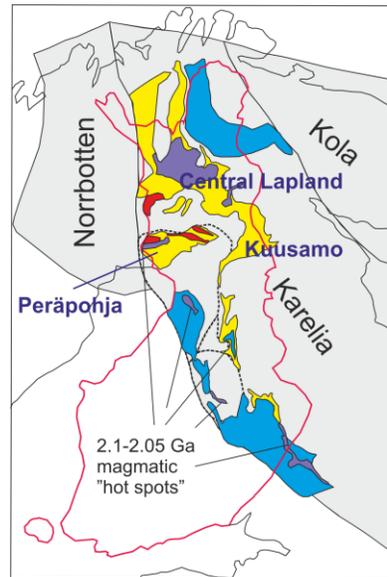

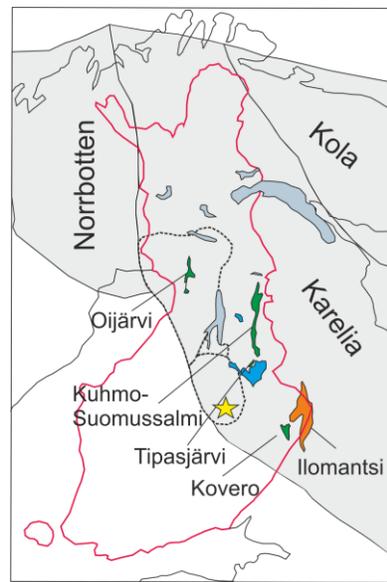

A - PA = Primitive arc complex of central Finland, ACF = Accretionary arc complex of central and western Finland, ASF = Accretionary arc complex of southern Finland.

B - CFGC = Central Finland Granitoid Complex, CLGC = Central Lapland Granitoid Complex, Jo = Jormua ophiolite, Ki = Kittilä greenstone complex, Nä = Näränkävaara, Ou = Outokumpu ophiolite, Ro = Rommaeno complex, So = Sokli carbonatite, TKS = Tipasjärvi-Kuhmo- Suomussalmi greenstone belt, To = Tornio, Tu = Tulppio.

## Major mineral systems

Type	Subtype	Metals	Age, Ga	Tectonic setting
Archean				
Orthomagmatic	Komatiites	Ni(-Cu)	2.95-2.75	Archean greenstone belt
Epigenetic-hydrothermal	Orogenic gold	Au	~2.7	Accretion-collision
Paleoproterozoic basins				
Orthomagmatic	Layered igneous complexes	Ni-Cu(-PGE)	2.44	Intracontinental rift
		PGE-reefs	2.44	
		Cr(-PGE)	2.44	
		Fe-Ti-V oxide	2.44	
	Komatiites	Ni(-Cu-PGE)	2.06	Continental margin rift
	Layered igneous complexes	Cu-Ni-PGE	2.06	
Sedimentary - polygenic	Talvivaara-type black schist	Ni-Zn-Cu-Co	2.0-1.90	Continental margin rift basin
Svecofennian orogeny				
Outokumpu-type	Outokumpu-type	Cu-Co	1.95-1.91	Oceanic ridge
Volcanic-hydrothermal	Volcanogenic massive sulphide	Cu-Zn	1.93-1.92	Island arc
Orthomagmatic	Synorogenic mafic-ultramafic intrusions	Ni-Cu(-PGE)	1.88	Arc-continent collision
Magmatic-hydrothermal	LCT pegmatites	Li, Nb-Ta	1.80-1.79	Continent-continent collision
Epigenetic-hydrothermal	Orogenic gold	Au-only	1.92 and 1.81-	Accretion-collision, late- to post-orogenic fault re-activation
		Au-Cu-Co-Ni	1.76	

# Orogenic gold provinces in Finland: Orogenic gold deposits with Au-only and atypical Au-Cu-Co-Ni metal associations

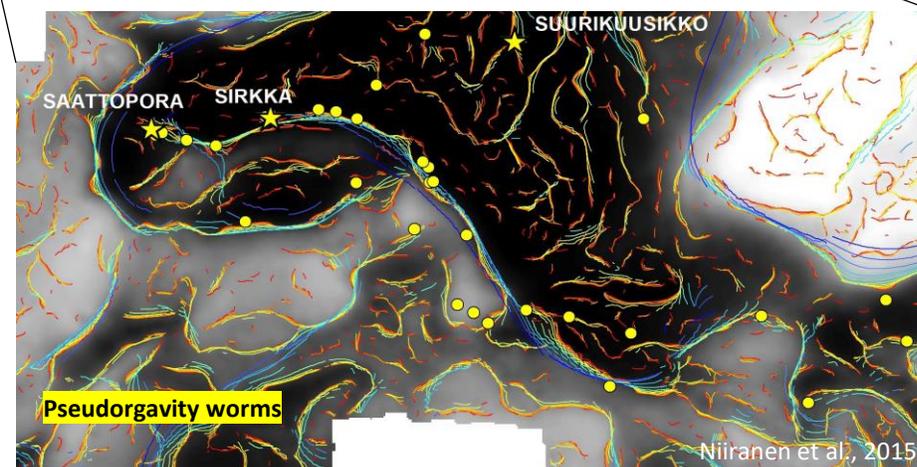

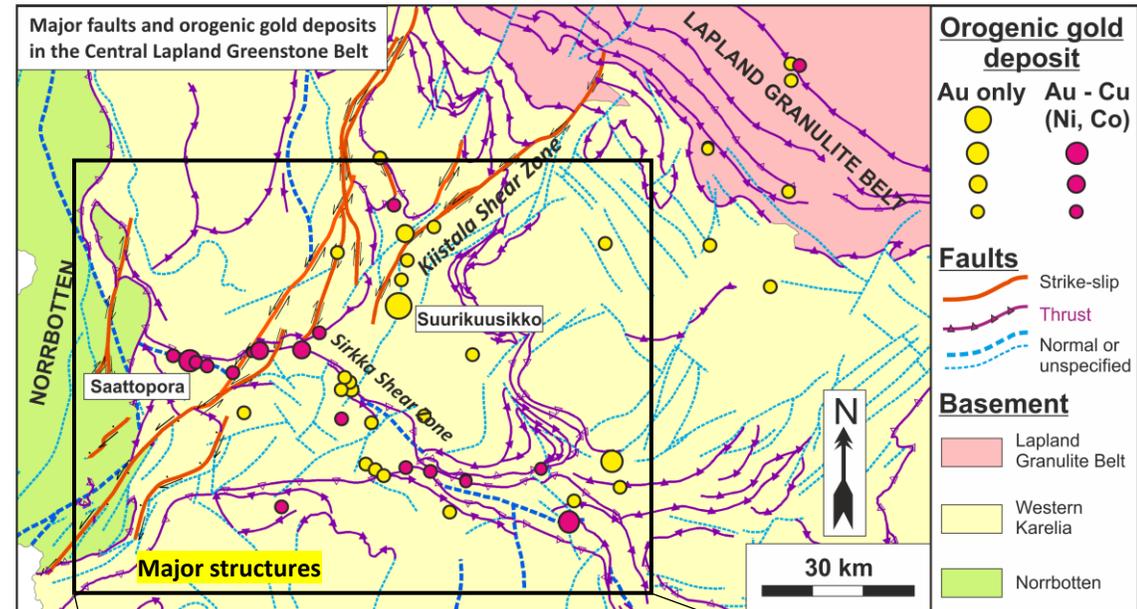

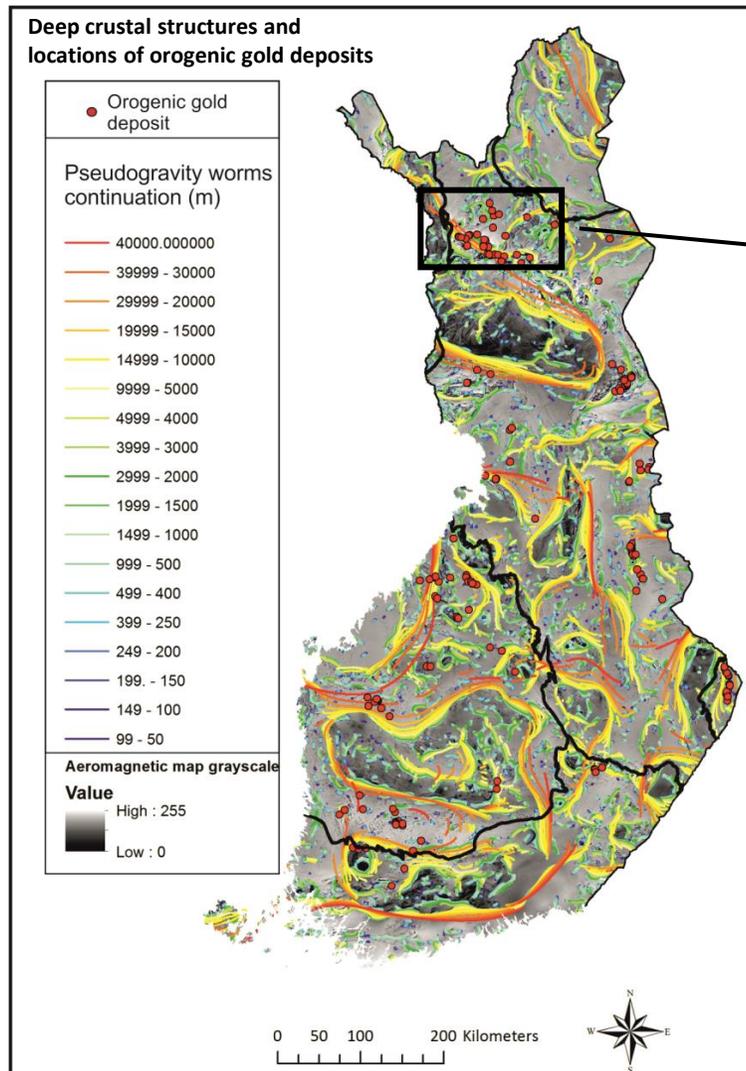

Gold resources in the largest deposits

# Orogenic gold mineral systems in Finland: structures and fluid flow

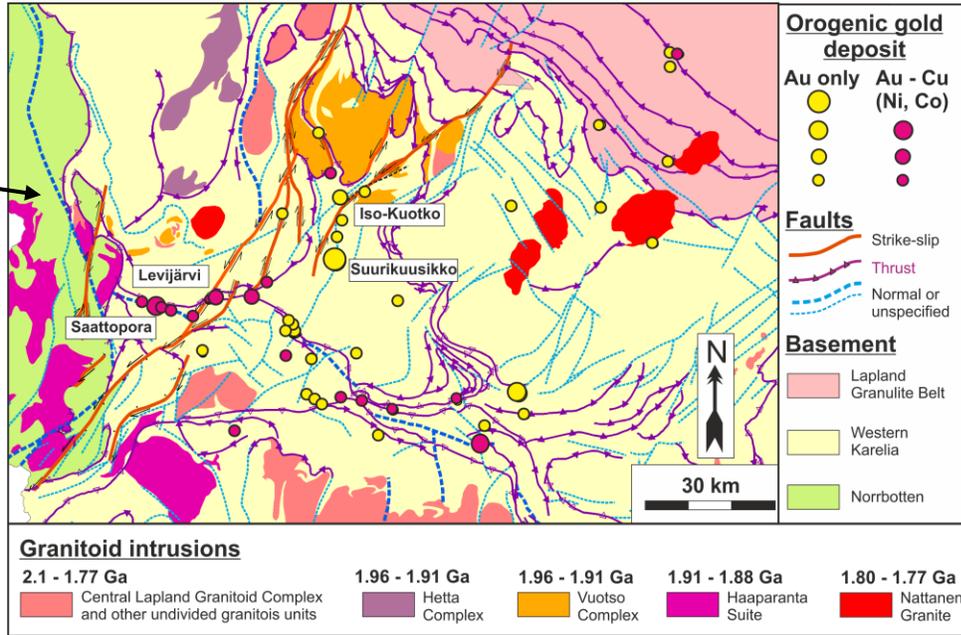

## Central Lapland Greenstone Belt (Kittilä orogenic gold province)

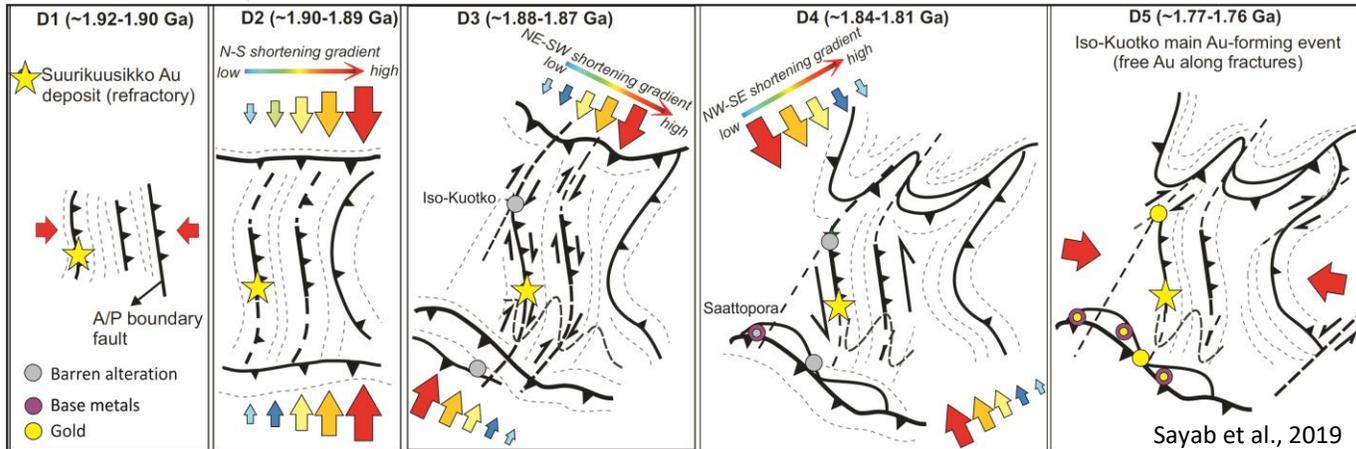

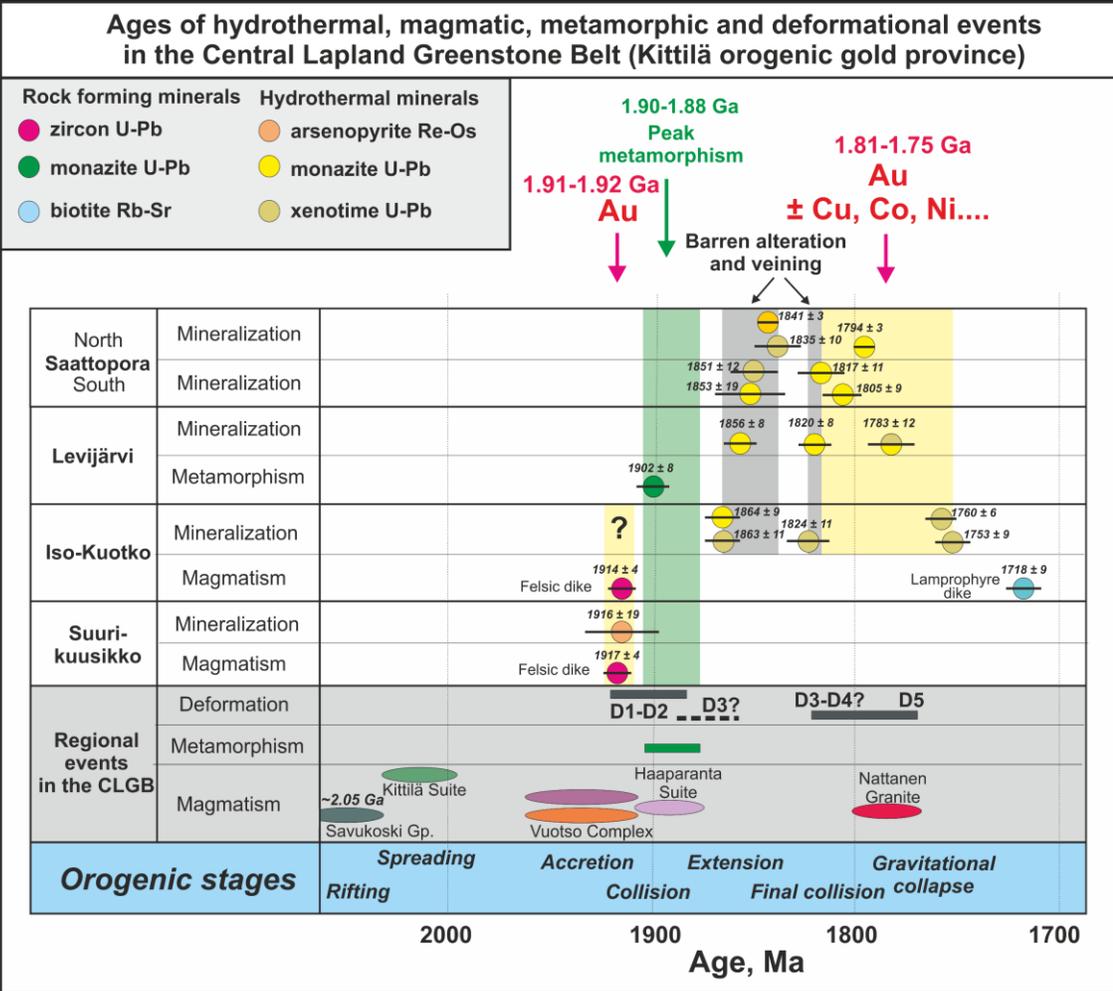

# Structural evolution and timing of ore deposition

## Central Lapland Greenstone Belt (Kittilä orogenic gold province)

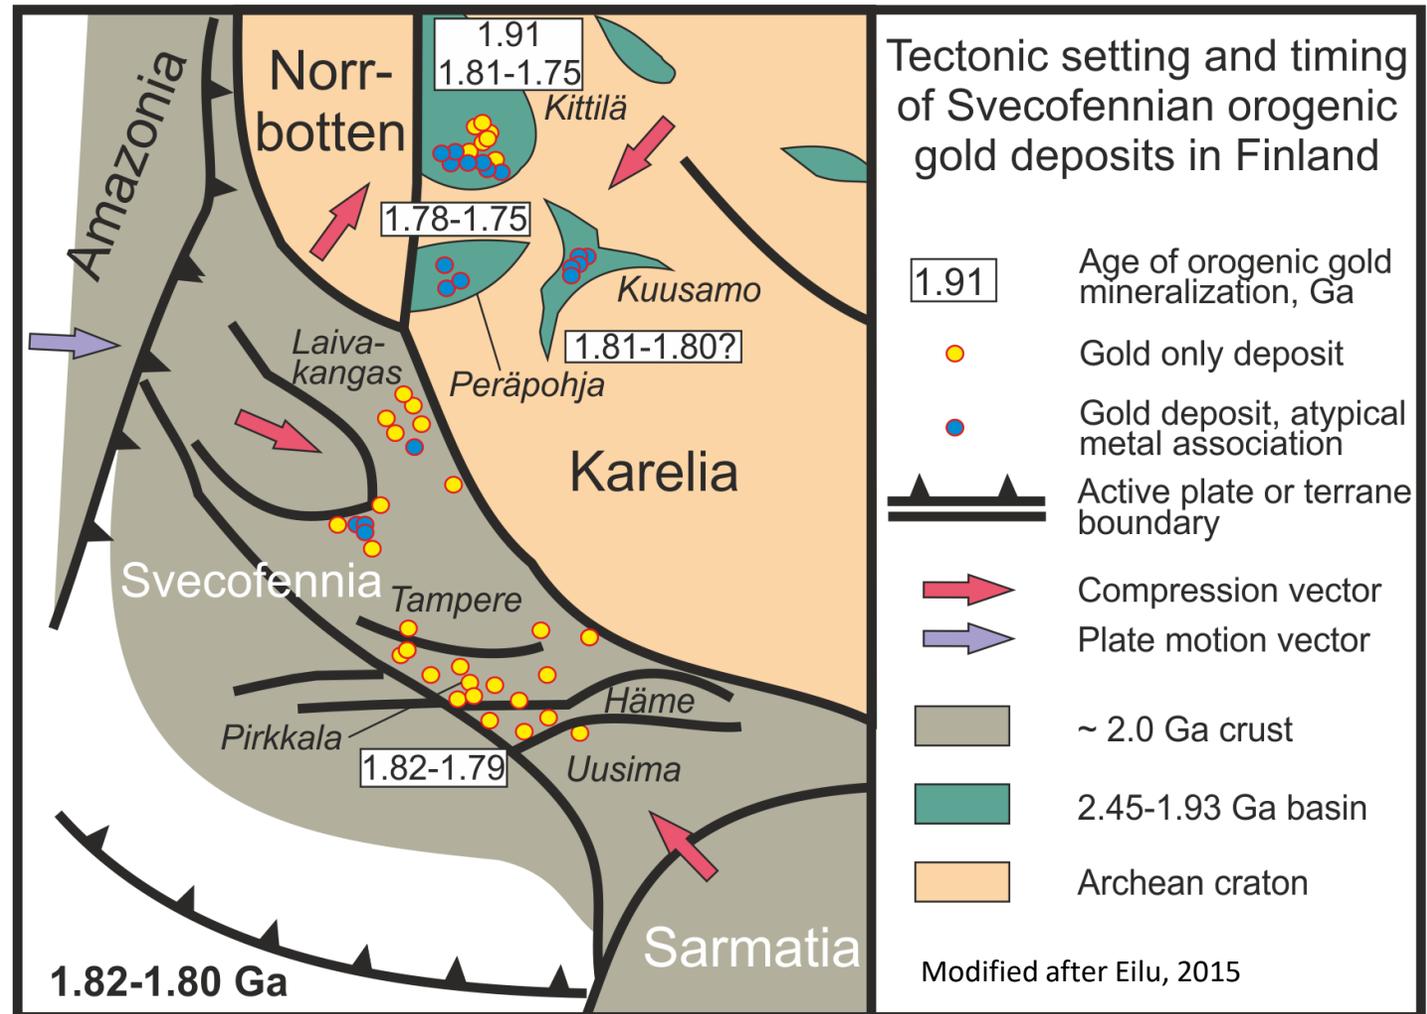

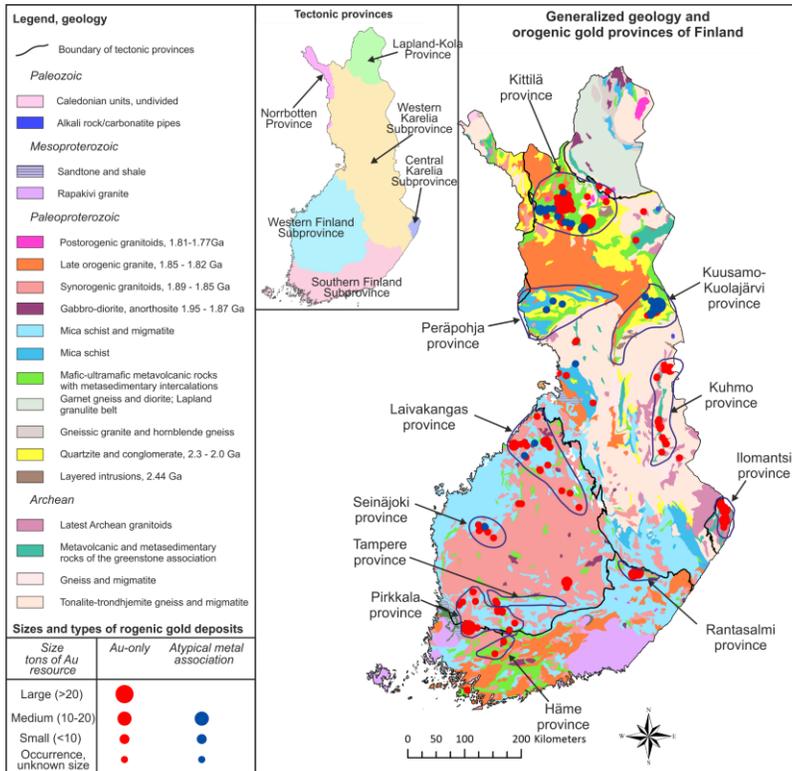

### Basement, structures and granitoid intrusions

### U-Pb and Re-Os geochronology of hydrothermal minerals with known structural-textural settings: barren and fertile hydrothermal events

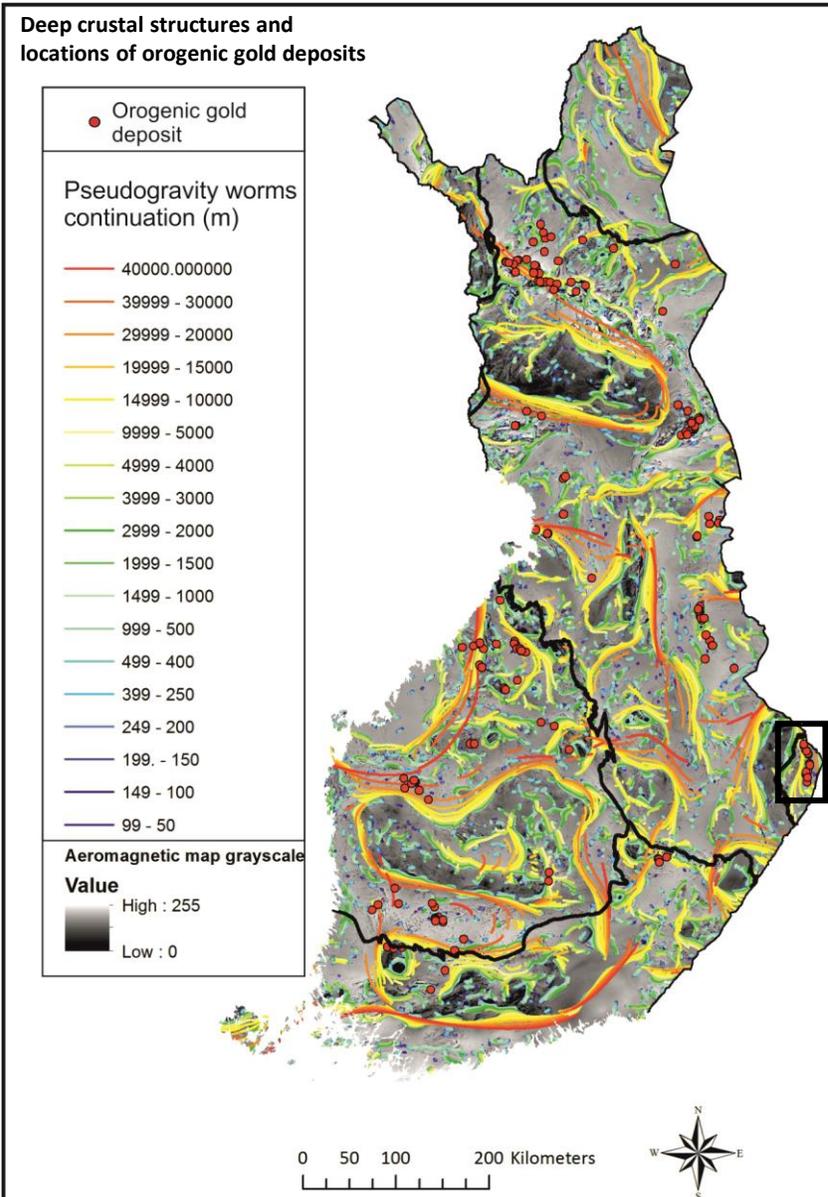

# Timing of orogenic gold deposition: Svecofennian orogeny, Finland

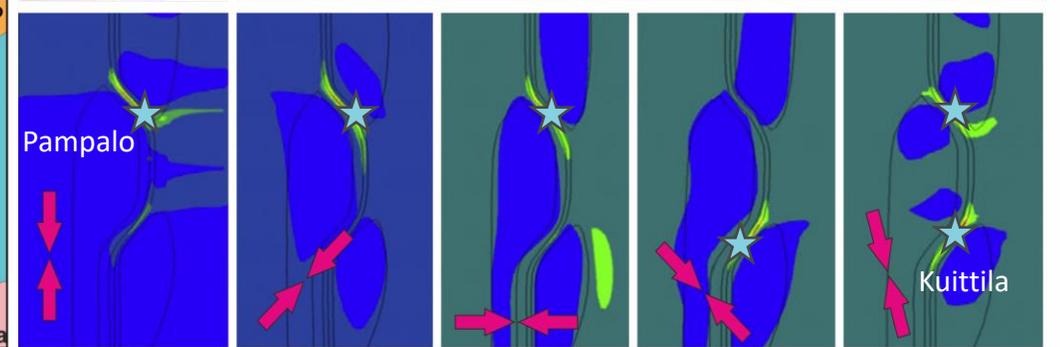

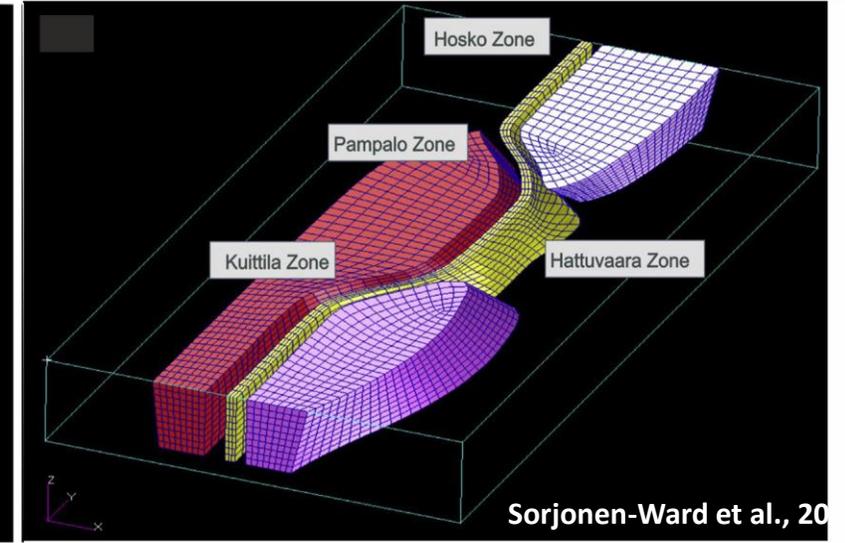

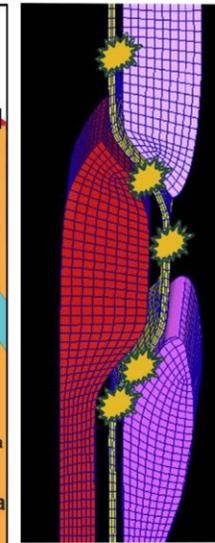

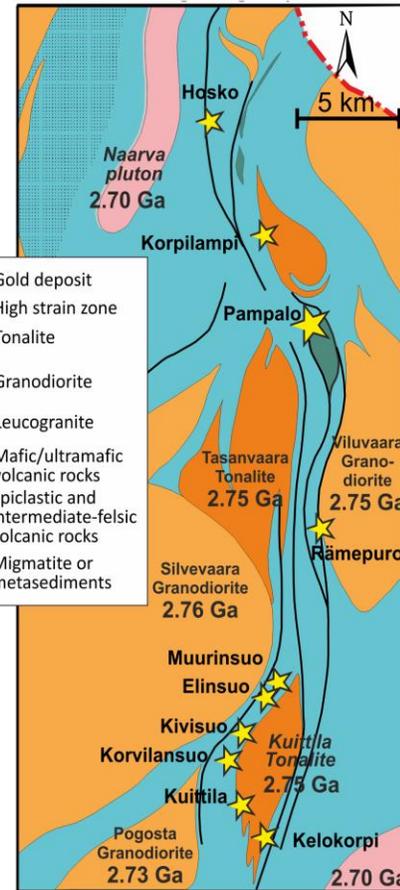

- Multiple hydrothermal events with fertile and barren stages
- The first fertile stage occurred at the early stage of accretion-collision, at 1.91-1.92 Ga in the Kittilä Province
- Most of gold deposited between 1.82 and 1.75 Ga at the late- to post-orogenic stages in all Svecofennian provinces

# Crustal structures and fluid flow Archean Hattu schist belt (Ilomantsi orogenic gold province)

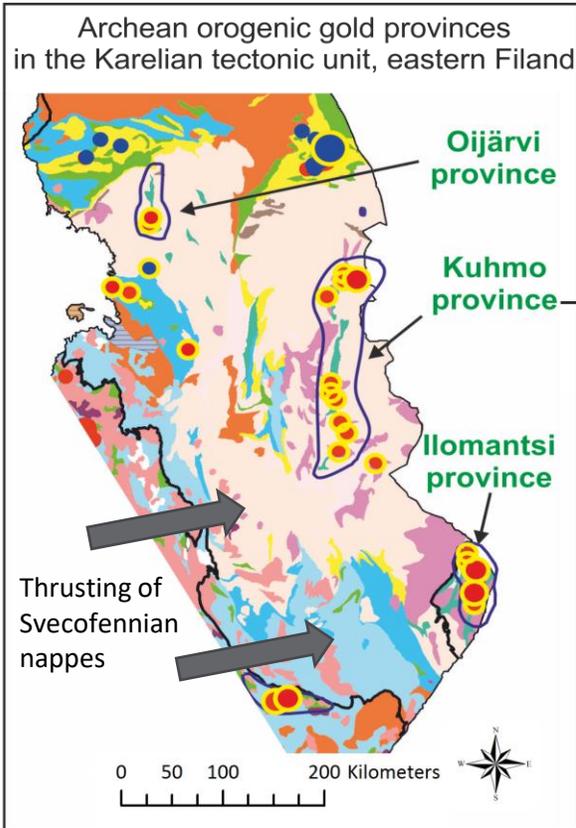

Hattu schist belt

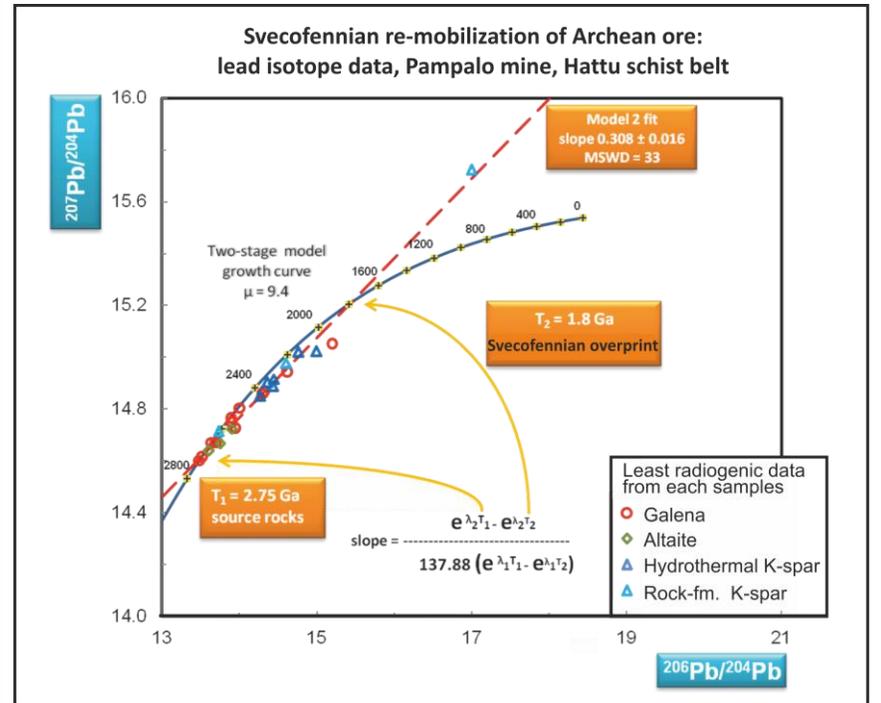

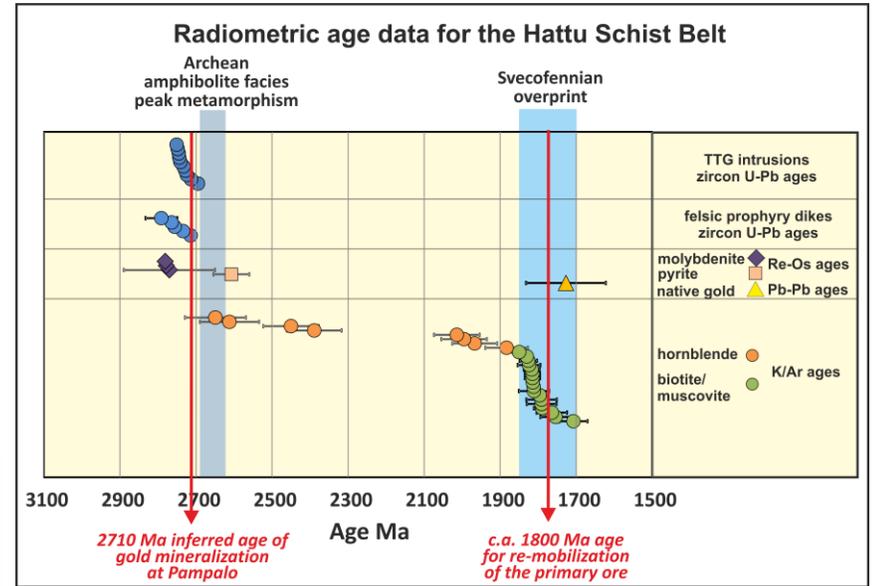

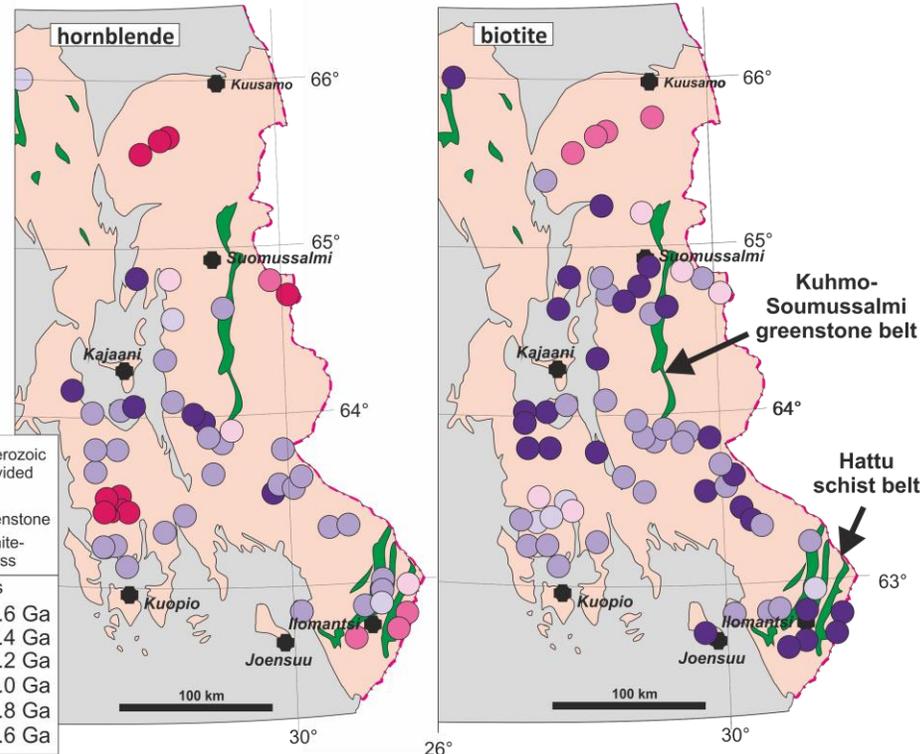

# Sevcofennian overprint on Archean orogenic gold systems

## Hattu schist belt (Ilomantsi orogenic gold province)

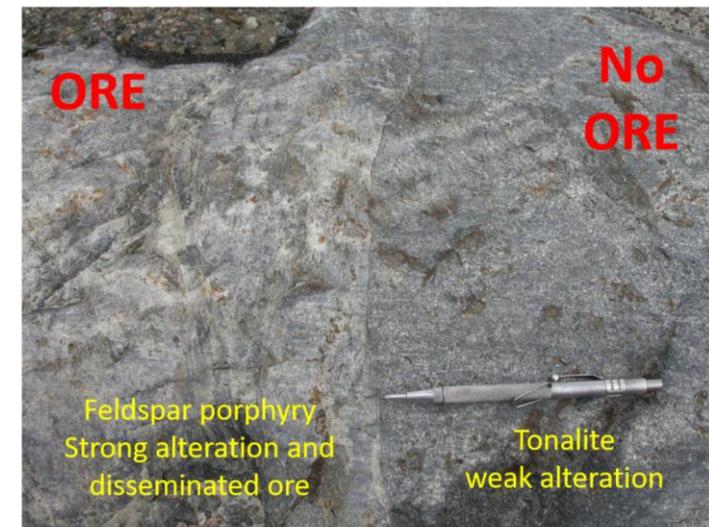

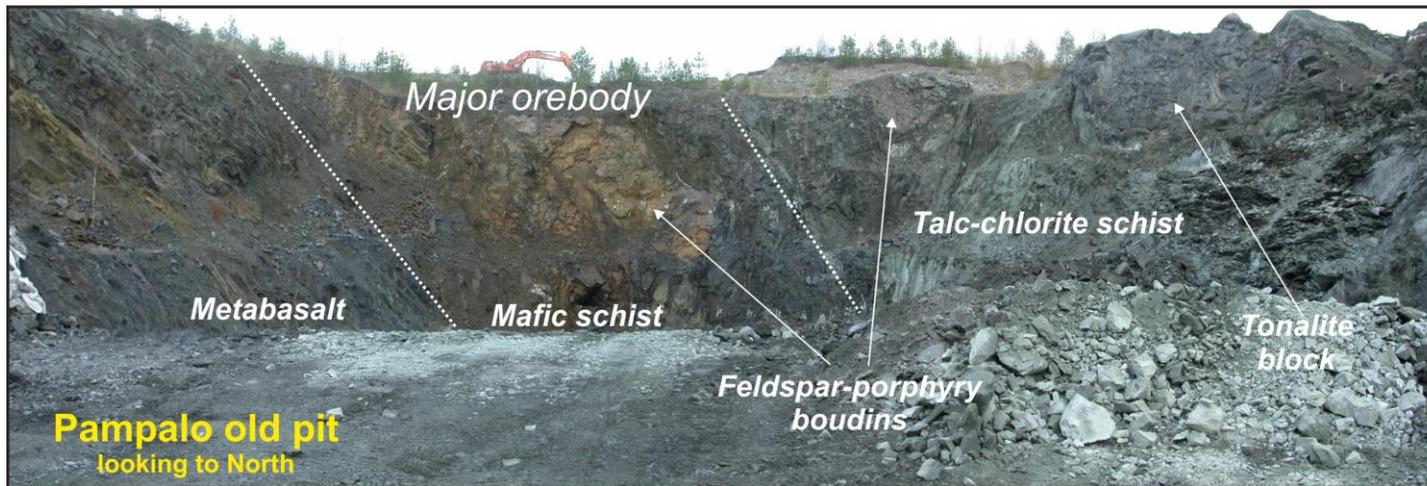

Potential modification of ~ 2.7 Ga primary mineralization: upgrading or re-mobilization during the 1.92-1.80 Ga Svecofennian orogeny

Distribution of K-Ar ages for hornblende and biotite from the Archean rocks of the Karelian domain in eastern Finland (redrawn after Kontinen et al., 1992)

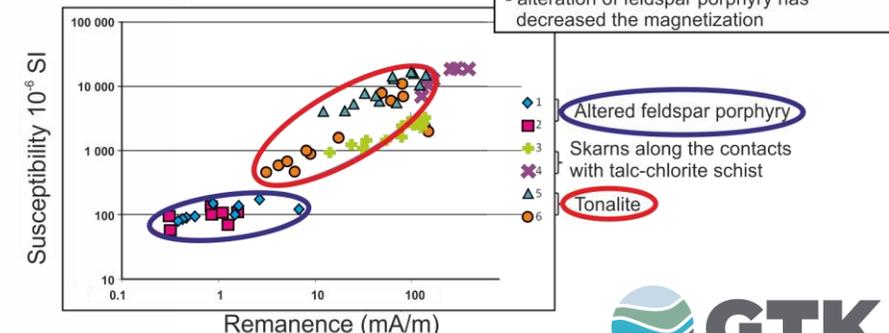

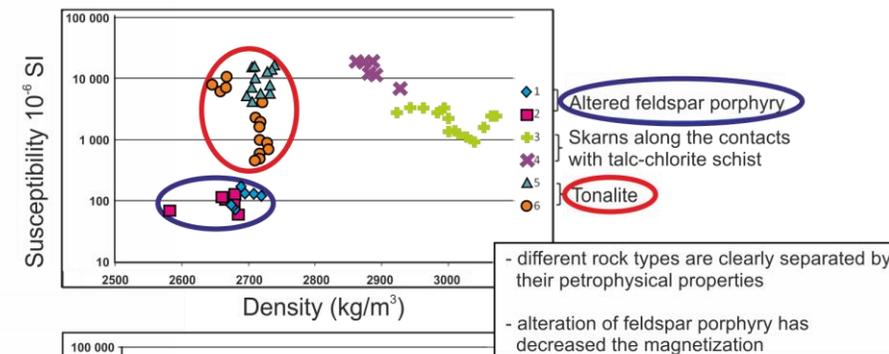

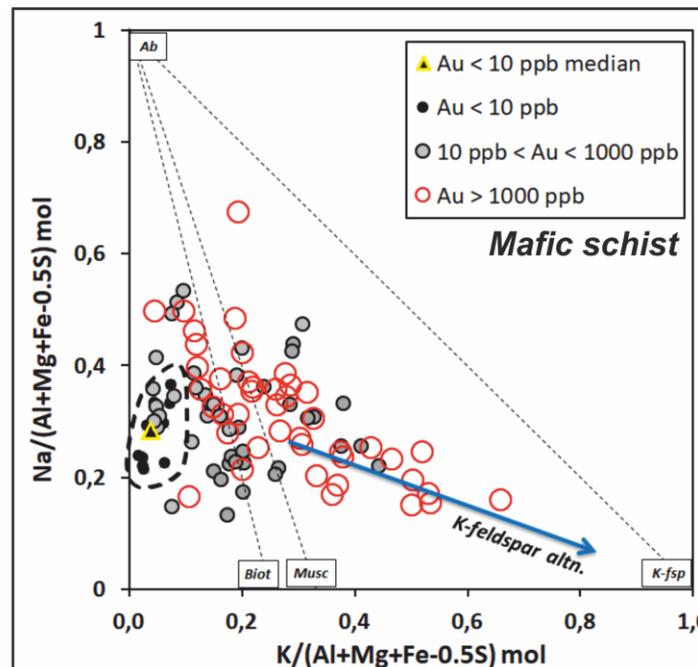

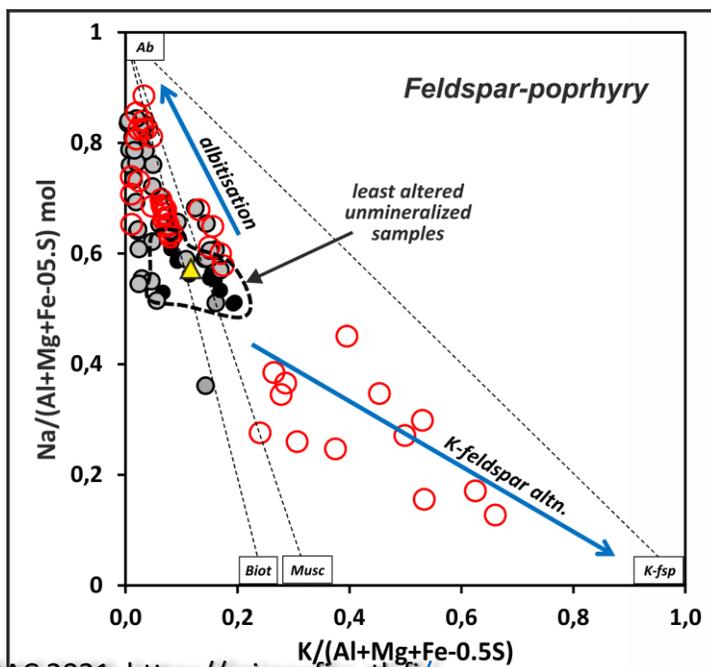

# Footprints: vectors to ore – lithogeochemistry and petrophysics

## Hattu schist belt, Pampalo mine (Ilomantsi orogenic gold province)

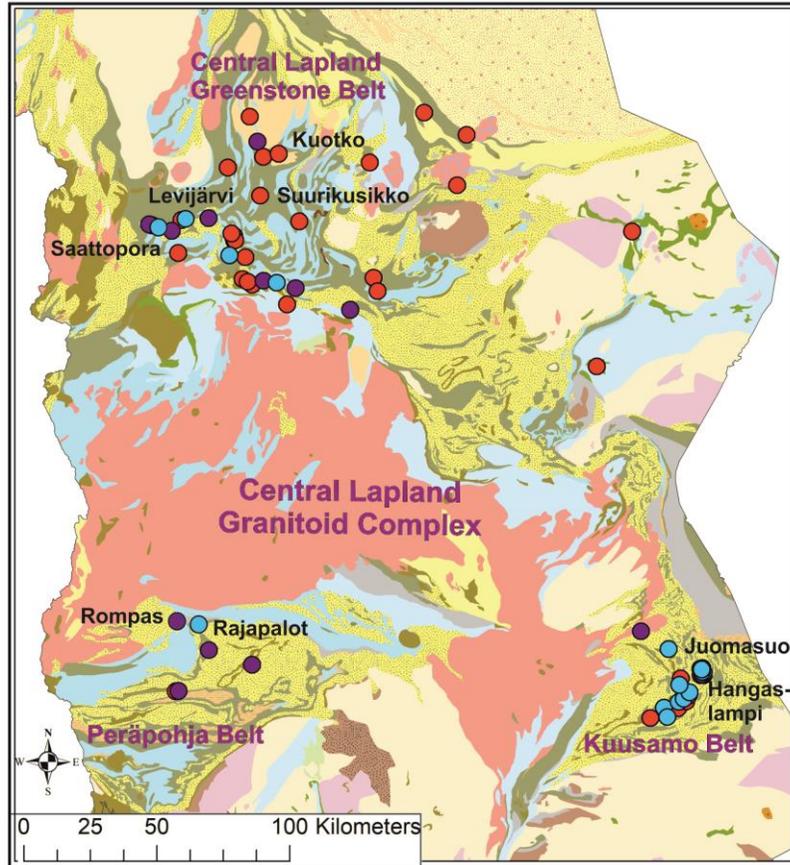

Zircon <sup>207</sup>Pb-<sup>206</sup>Pb ages :      Zircon <sup>207</sup>Pb-<sup>206</sup>Pb age:

2712±4 –2717±8 Ma      2725 ± 12 Ma

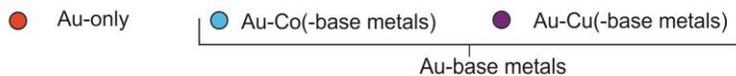

# Footprints: development of vectoring tools based on mineral trace elements

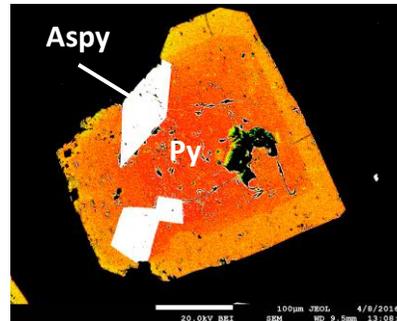

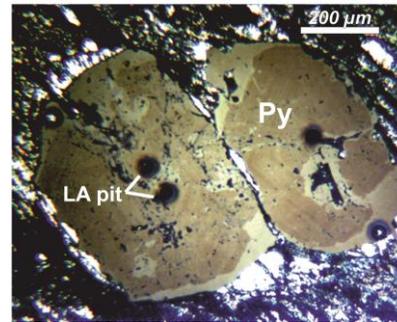

Au-only and Au-base metal orogenic gold deposits northern Finland  
(Central Lapland Greenstone Belt, Kuusamo Belt, Peräpohja Belt)

Orogenic gold deposits

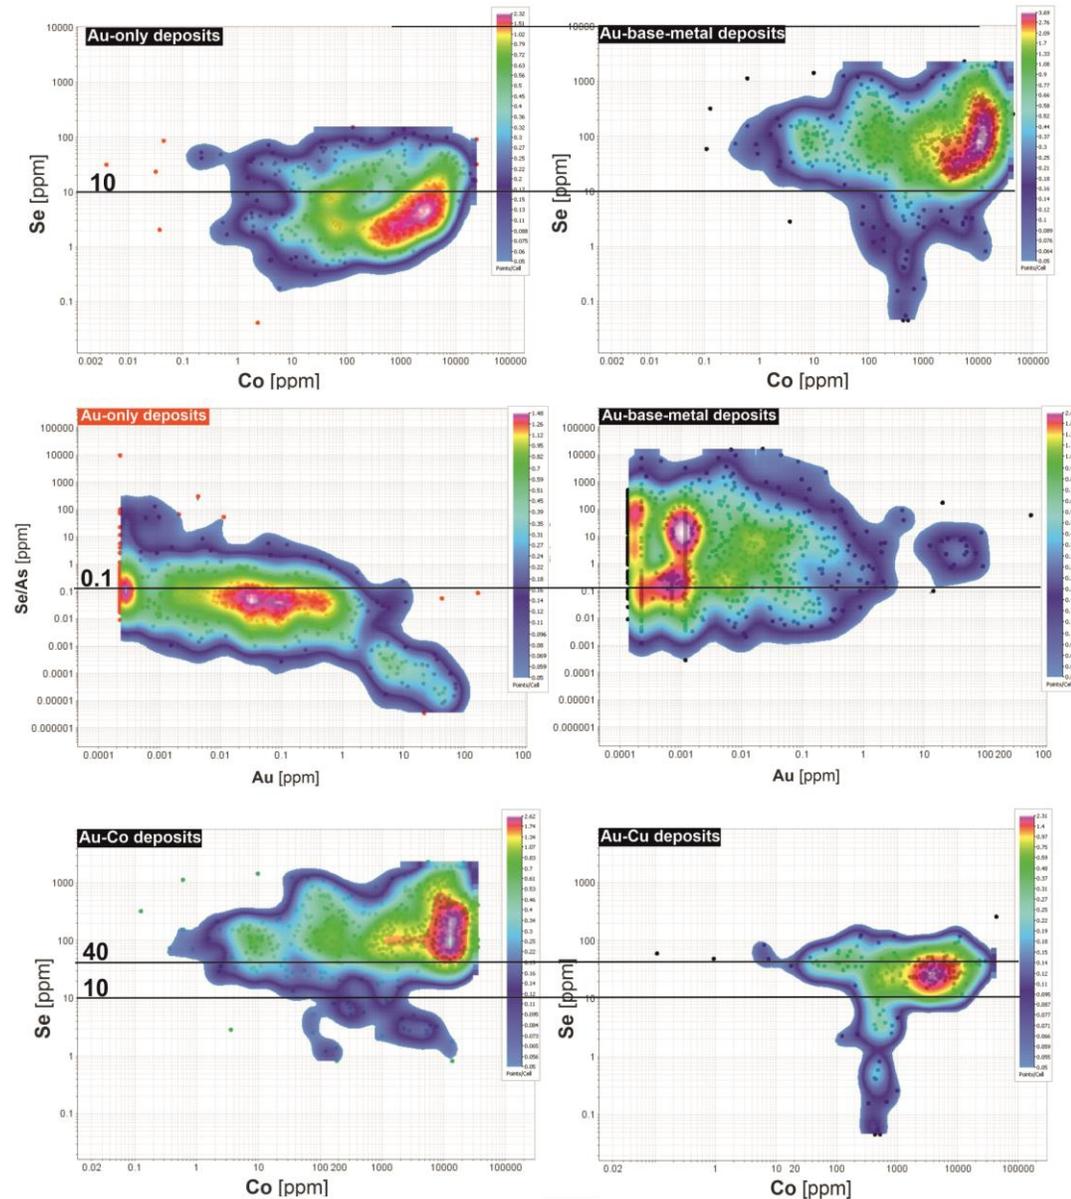

Trace element analyses by LA-ICPMS  
In polished sections with known  
structural, textural and paragenetical  
settings of minerals.

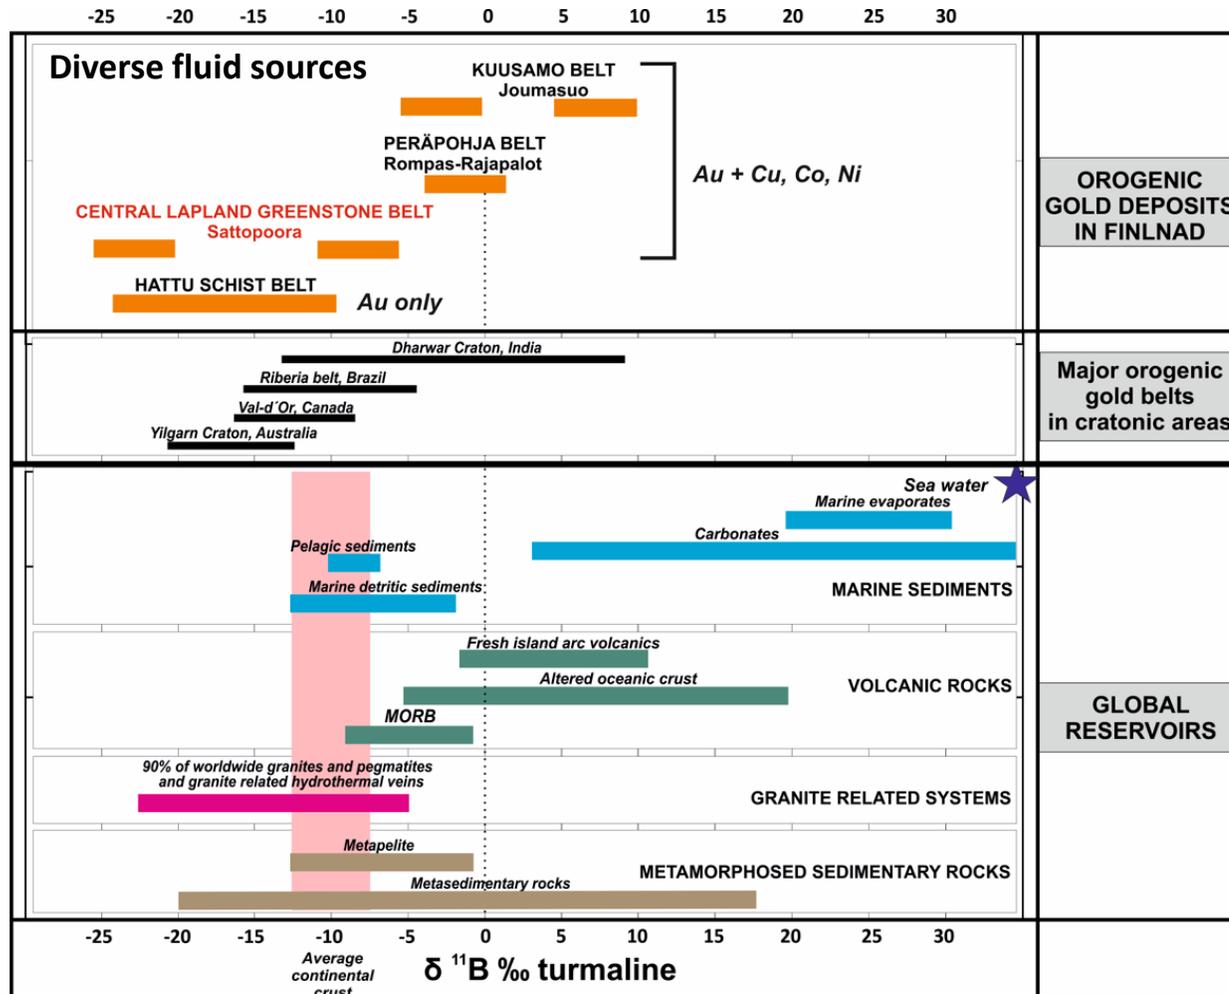

Primary footprint properties  
of minerals is inherited  
in secondary footprints (e.g. till,  
stream sediments).

Trace elements in pyrite

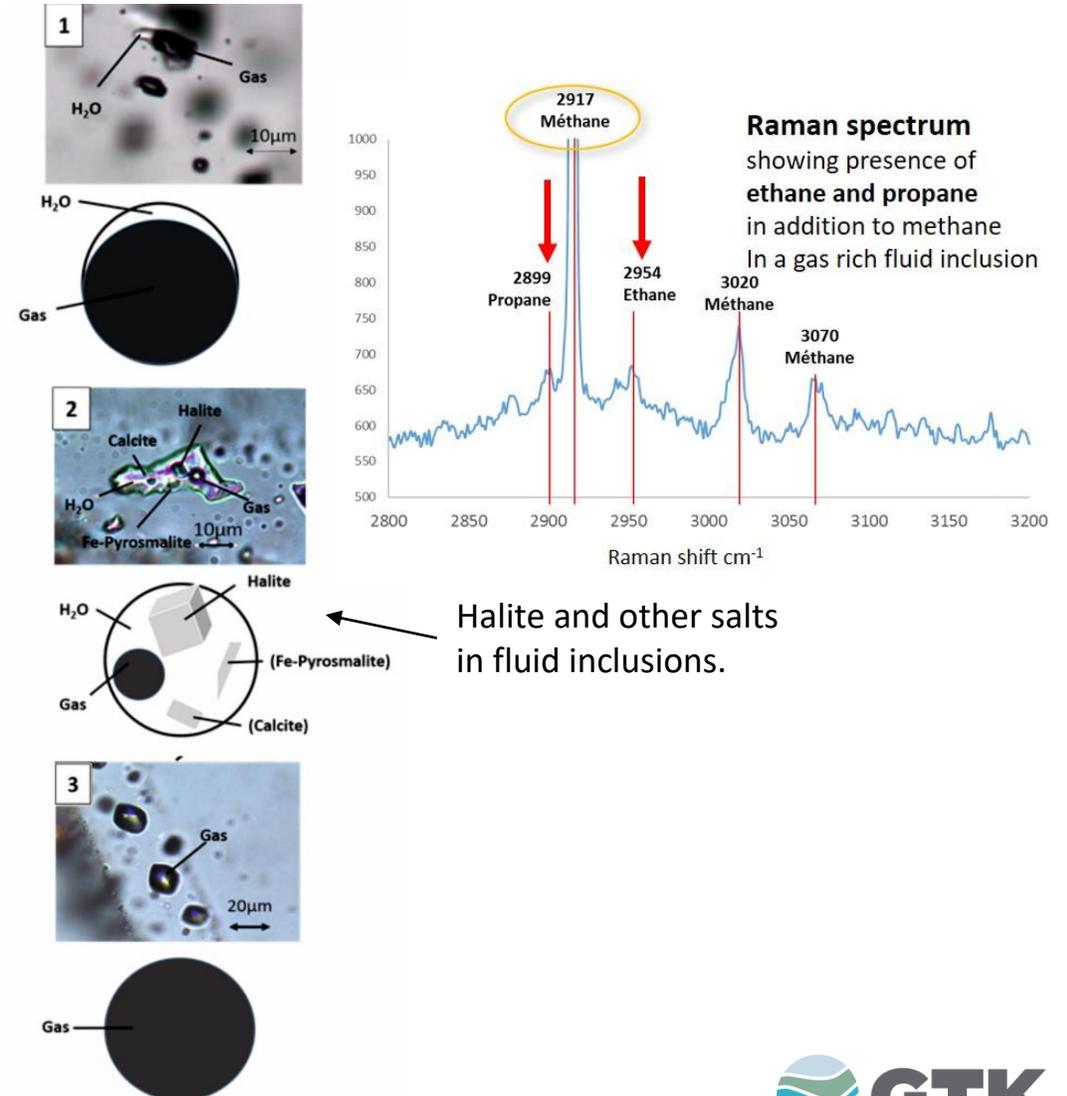

# Sources of fluids

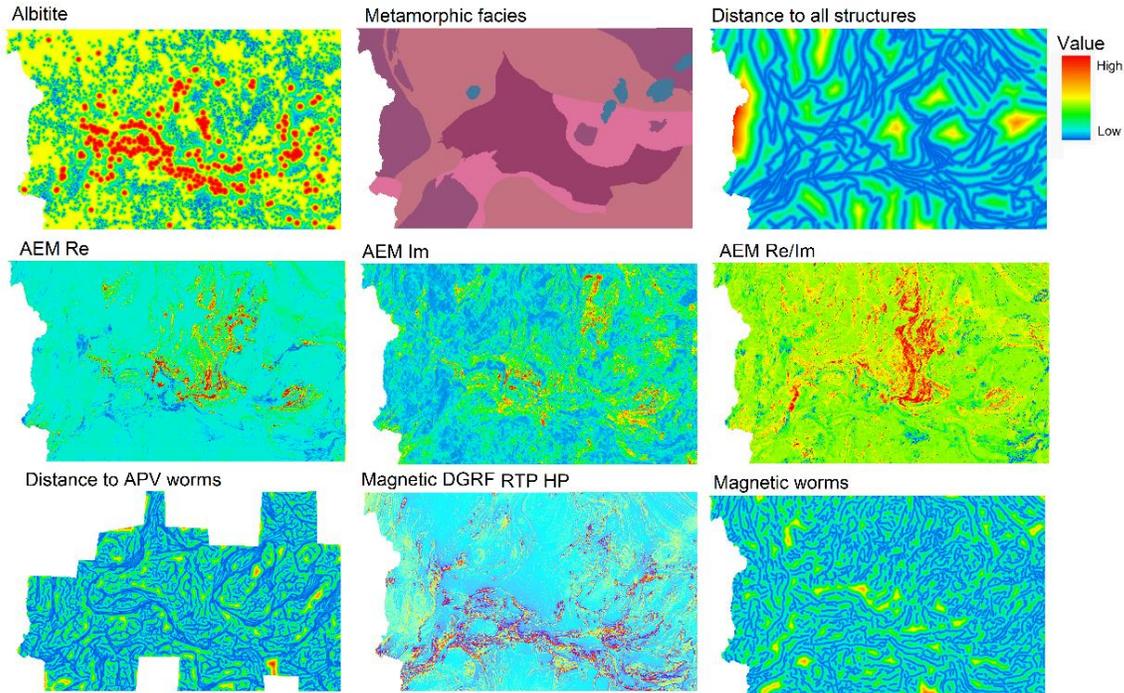

## Boron isotope data from tourmaline

## Compositions of fluids inferred from fluid inclusions

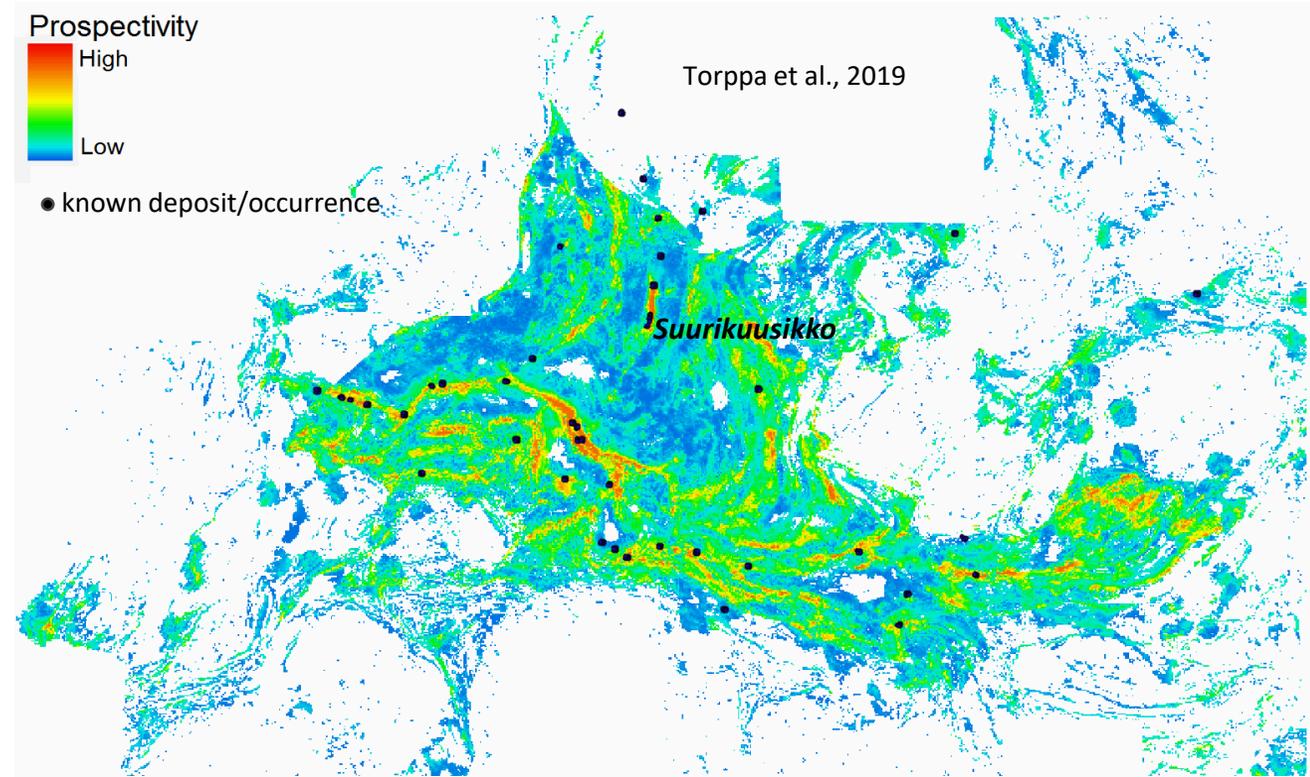

# Implication of key parameters of orogenic gold mineral systems: province-scale mineral prospectivity evaluation

## Key mineral system parameters

- structures: faults and rock contacts
- metamorphism
- alteration
- distribution of black schists

## Central Lapland Greenstone Belt (Kittilä orogenic gold province)

## Conclusions

Orogenic gold mineral systems are present in Archean and Paleoproterozoic (Svecofennian) tectonic domains of Finland.

Orogenic gold deposits with Au-Co-Cu-Ni (atypical) metal associations are common in northern Finland.

Orogenic gold systems with atypical metal associations are potential future sources of cobalt.

Building up robust geochronological, lithogeochemical, mineral trace element and isotope geochemistry databases for orogenic gold mineral systems of Finland form the basis of development of new models and exploration tools in various projects at GTK.

Incorporation of mineral systems`critical parameters into mineral prospectivity mapping supports better prediction of areas with enhanced potential of orogenic gold deposits.
